## Mineralic Ion Exchanger

Mineralic ion exchanger for biodegradation of organic residues present in waste waters, Formulated specially to accelerate the reactions of mineralization of organic substrates in all sewage water environments.

The product activates biodegradation action of the organic residues present in the waste waters and sediments, allowing for their mineralization. This biodegradation action also reduces the quantity of organic materials in the sediment allows for increase in oxygen availability in the water column and the reactivating of mineralization processes so it allows the deepest sediments to be reached without dispersion and increasing efficiency, And Ion exchange now is widely used in pollution control.
